Screw the upright post on the side of the bench using 2 tek screws. Space out evenly along the bench, they will normally be spaced about 4'6" to 7' between the post (typically the same number of plant support system uprights are used as legs)

Place plant support system cross bars on uprights. And use the provided thumb screw to tighten to the desired starting level. **Please note:** we suggest you point thumb screws in on the end for safety.

Once all the cross bars are attached and tightened, lay the stringer pipes along the cross bars and secure them using square to square clamps, bolts and nuts. \*This is the same as installing stringer pipes along the legs\*
